

ABSTRACT

The invention concerns a bracket, e.g., for securing a vent cover to a vent. The bracket includes a plate having a front face, a back face, a length, a width, and opposing side edges extending in respective length and width directions. The plate includes at least two openings in the plate, each opening wholly contained within the front and back faces so as to not intersect with the side edges. The plate also includes at least one pair of orifices in the plate, the pair of orifices located adjacent opposite side edges of the plate along the length of the plate so as to form a weakened zone widthwise for bending the plate along the weakened zone.
